

OFFICE OF THE CHIEF PUBLIC HEALTH OFFICER

PUBLIC HEALTH ADVISORY

Carfentanil and fentanyl detected in drugs in Hay River

NORTHWEST TERRITORIES (December 2, 2022) – The ongoing detection of carfentanil and fentanyl in other drugs in Hay River has prompted the Chief Public Health Officer to issue a public health advisory regarding the dangers associated with illicit drugs in the Northwest Territories.

Drugs in Hay River, including cocaine, crack cocaine and marijuana, have been found to contain fentanyl and carfentanil. People who use drugs should be aware that the drugs they are using may contain other substances which can cause an overdose. All people who use drugs should have naloxone on hand and be prepared to use it in the event of an overdose and should have someone present when using drugs.

Carfentanil is one of the most toxic opioids known, with studies showing it is 10,000 times more toxic than morphine, 4,000 times more toxic than heroin, and 100 times more toxic than fentanyl. Reversing carfentanil may require more than one dose of naloxone.

Today’s advisory is to alert the public of the presence of carfentanil and fentanyl in illicit drugs in the Northwest Territories. Carfentanil and fentanyl have now been detected again in drugs in Hay River.

Carfentanil, fentanyl and other related synthetic compounds are extremely toxic and can cause immediate and unexpected overdose even in frequent users who have high levels of drug tolerance. Even small quantities can result in overdose and death. People who use substances can never be certain if the illicit drugs they purchase contain these substances.

“The detection of carefentanil and fentanyl in the NWT is very concerning, and it is important to recognize that these toxic opioids can be found in other drugs, which users may not be aware of. All those who use, provide, or are part of the response to illicit drug use in NWT, including experienced users, should be aware that carfentanil and fentanyl is present in NWT drugs.” said Dr. Kami Kandola, Chief Public Health Officer.

The public is warned against touching or handling in any way, any suspect substance. Unintentional exposure to pure fentanyl or carfentanil, including touching, ingesting, or

inhaling, can cause serious harm including death.

If you suspect an overdose call an ambulance or your local health centre. Signs and symptoms of overdose can include the following:

- Breathing will be slow or absent;
- Lips and nails are blue;
- Person is not moving;
- Person is choking;
- Gurgling sounds or snoring;
- Severe sleepiness
- Person can't be woken up; or
- Skin feels cold and clammy.

The *Good Samaritan Drug Overdose Act* protects people involved in an overdose from being charged for possession of a controlled substance. This law encourages anyone to call for help if they witness or experience an overdose.

Residents are reminded that Naloxone kits (opioid reversing agent) are available at all hospitals, health centres and pharmacies in the NWT. In Hay River, residents can pick up Naloxone kits at the Hay River Regional Health Centre, Public Health and Ring's Pharmacy. In the Hay River Reserve, Naloxone kits can be picked up at the Judith Fabian Elders Centre. Note that naloxone is only effective in the case of an opioid overdose. However, if you are unsure of the substance(s) involved, it's best to err on the side of caution and administer it. Naloxone is not known to cause any harm in the case of a non-opioid overdose. Carfentanil overdoses may require repeated doses of naloxone.

People who use drugs should use them with others present, start with small amounts, and should have naloxone nearby and know how to use it. Don't mix drugs with other drugs, or with alcohol. Mixing substances increases the risk of overdose.
